AB		A medium and method for culturing lymphocytes are provided for determining intracellular concentration of glutathione or cysteine in human lymphocytes to provide biochem. anal. of an individual's capability of dealing with oxidative stress. The medium is a buffered serum-free solution having a pH of from about 6.8 to 7.6 and containing a carbohydrate which is glucose or a compound capable of producing glucose in lymphocytes, pantothenic acid, choline or a substance capable of producing choline in lymphocytes, inorg. ions including chloride, phosphate, calcium, magnesium, potassium, sodium and iron, L-Buthionine-[S.R.]-Sulfoximine, deionized water and a mitogen to stimulate lymphocytes. When determining cysteine concentration, the medium addnl. contains N-Acetyl-L Cysteine and Cumene Hydroperoxide. The method is carried out by inoculating the culture medium with lymphocytes from an individual, incubating the lymphocytes in the medium and comparing the response of the lymphocytes with an average response of lymphocytes from a control group of individuals.

AB WO 9810092 A UPAB: 19980528

A cell culture medium, which is useful for (i) determining levels of intracellular function of glutathione in lymphocytes and (ii) performing biochemical analysis of the antioxidant function of the lymphocytes, comprising a buffered, serum-free medium (pH 6.8-7.6) comprising: (a) a carbohydrate (which is glucose or a compound capable of producing this in the lymphocytes); (b) a biologically usable form of pantothenic acid, choline or a biologically usable form of a substance capable of producing choline in the lymphocytes; (c) inorganic ions comprising chloride, phosphate, calcium, magnesium, potassium, sodium and iron in a biologically utilisable form; (d) L-buthionine-(S,R)-sulphoximine (I); (e) deionised water, and (f) a mitogen in an amount effective to stimulate the lymphocytes. Also claimed is a cell culture medium, which is useful for (i) determining levels of intracellular function of cysteine and (ii) performing biochemical analysis of the antioxidant function of human lymphocytes, having identical composition to the medium above, but instead of (I) containing cumene hydroperoxide.

The media comprises a 5-500 μ M concentration of (I) or a 50-500 μ M concentration of (II). The media may be supplemented with amino acids and/or vitamins. The amino acids are selected from L-arginine, L-cysteine, L-glutamine, glycine, L-histidine, L-isoleucine, L-leucine, L-lysine, L-methionine, L-phenylalanine, L-serine, L-threonine, L-tryptophan, L-tyrosine and L-valine. The vitamins are selected from biotin, folic acid, nicotinamide, nicotinic acid, riboflavin, thiamine, vitamin B6 and vitamin B12. Processes in which the media are used typically comprise: (a) inoculating the medium with lymphocytes from an individual; (b) incubating the inoculated medium, and (c) comparing the response of the lymphocytes with an average response of lymphocytes from a control group of individuals.

USE - The media may be used in processes for measuring levels of intracellular function of cysteine and glutathione, so as to provide a measurement of an individual's ability to prevent degenerative disease and deal with oxidative stress, and to allow therapeutic measures to be taken to improve an individual's antioxidant profile. It is widely accepted that certain conditions (e.g. ageing, arthritis, cancer, atherosclerosis, myocardial infarction, stroke, viral infection, pulmonary conditions, bowel diseases and neurodegenerative disease) can develop due to the presence of reactive oxygen molecules.

AB	<p>A medium and method for culturing lymphocytes are provided for determining intracellular concentration of glutathione or cysteine in human lymphocytes to provide biochem. anal. of an individual's capability of dealing with oxidative stress. The medium is a buffered serum-free solution having a pH of from about 6.8 to 7.6 and containing a carbohydrate which is glucose or a compound capable of producing glucose in lymphocytes, pantothenic acid, choline or a substance capable of producing choline in lymphocytes, inorg. ions including chloride, phosphate, calcium, magnesium, potassium, sodium and iron, L-Buthionine-[S.R.]-Sulfoximine, deionized water and a mitogen to stimulate lymphocytes. When determining cysteine concentration, the medium addnl. contains N-Acetyl-L Cysteine and Cumene Hydroperoxide. The method is carried out by inoculating the culture medium with lymphocytes from an individual, incubating the lymphocytes in the medium and comparing the response of the lymphocytes with an average response of lymphocytes from a control group of individuals.</p>

AB The present invention provides a cell culture medium useful for a biochem. anal. of antioxidant function in human lymphocytes, said medium comprising, a buffered, serum-free solution containing the following ingredients: a carbohydrate selected from the group consisting of glucose and a compound biol. capable of producing glucose in the cells; a biol. usable form of pantothenic acid; choline or a biol. usable form of a substance capable of producing choline in the cells; inorg. ions comprising chloride, phosphate, calcium, magnesium, potassium, sodium; and iron in a biol. utilizable form, cumene hydroperoxide, deionized water, and a mitogen in an amount effective to stimulate the lymphocytes being assayed; said buffered, serum-free solution having a pH from about 6.8 to 7.6, said cell culture medium characterized by being effective to determine nutritional deficiencies, inadequacies, and imbalances and to biochem. analyze antioxidant function of the lymphocytes. Also provided is a method of biochem. analyzing cellular antioxidant function in an individual

comprising the steps of: inoculating the cell culture medium of the present invention with lymphocytes from said individual; incubating the inoculated cell culture medium; and comparing the response of the lymphocytes with an average response of lymphocytes from a control group of individuals.

AB The present invention relates to long-term multiplication and permanent establishment of a cell line of human liver epithelial cells (hepatocytes). The human liver epithelial cell line is capable of mitotically proliferating and continuously growing in vitro under suitable environmental conditions in suitable culture media. A method of producing an immortalized human liver epithelial cell line is also disclosed. The invention also relates to serum-free cell medium developed to support long-term multiplication and permanent establishment of a cell line of human liver epithelial cells. The medium may contain an effective cell growth-promoting amount of calcium ions; an effective cell growth-promoting amount of glucose; an effective amount of insulin to aid cells in glucose uptake; an effective cell growth-promoting amount of hydrocortisone; an effective amount of epidermal growth factor to bind epidermal growth factor receptors on cells; an effective amount of transferrin to increase DNA synthesis in cells; an effective amount of cholera toxin to increase DNA synthesis in cells; an effective amount of triiodothyronine to increase DNA synthesis in cells; and an effective growth-promoting amount of mammalian hormones and mitogenic factors, including lipoprotein, cholesterol, phospholipids, and fatty acids.

AB Organic solutes often exhibit a delayed reaction in the indigo [68651-46-7] test for dissolved O3 which is similar to the reaction of O3 itself. This phenomenon has made timing critical in aqueous O3 measurements and has been observed in both laboratory samples containing high organic C:O3 ratios and in potable water containing low organic C:O3 ratios. Organic hydroperoxides, singlet O, and Fenton's reagent interfere, but triplet O, H2O2, and p-benzoquinone do not interfere. Addition of phenolic antioxidants inhibited the interference.

CC 15-8 (Immunochemistry)
AB Products of polyamine oxidase activity, at micromolar levels and during a period of 2 to 3 days, down-regulated IL-2 mRNA levels and activity in human lymphocytes. The authors studied whether this suppression was associated with signal transduction abnormalities. The authors found that polyamine oxidase activity suppresses both anti-CD3-induced IL-2 production and protein tyrosine phosphorylation. Polyamine oxidase activity also

caused a reduction in intracellular calcium mobilization after mitogenic stimulation. The most distal step of CD3-mediated signal transduction is dependent upon transcription factors that regulate a set of genes, including IL-2. It was found that polyamine oxidase-treated cells exhibited very low DNA binding activity of two such factors: NFAT and NF- κ B. On the other hand, AP-1 DNA binding activity was enhanced in polyamine oxidase-treated cells, suggesting a possible role for AP-1 in the human lymphocyte stress response. In accordance with the oxidation dependence of this suppressive mechanism, N-acetylcysteine (NAC; an antioxidant) significantly reversed the polyamine oxidase effects on lymphokine production and signal transduction. These results suggest that NAC contributes, under oxidizing conditions, to the preservation of immune function. Thus, the data suggest that chronic low-level oxidative stress, via suppression of mitogen-induced transmembrane signaling (protein-tyrosine phosphorylation and calcium mobilization), causes a decrease in the DNA binding activity of transcription factors that regulate the IL-2 gene. This results in decreased IL-2 production

 (T-cell, oxidative stress suppression of transmembrane and nuclear signal transduction in human T lymphocyte)
- IT Lymphokines and Cytokines
 RL: ADV (Adverse effect, including toxicity); BSU (Biological study, unclassified); MFM (Metabolic formation); BIOL (Biological study); FORM (Formation, nonpreparative)
 (interleukin 2, mRNA-specifying; oxidative stress suppression of transmembrane and nuclear signal transduction in human T lymphocyte and)
- IT 124-20-9, Spermidine 7440-70-2, Calcium, biological studies
 7722-84-1, Hydrogen peroxide, biological studies 9001-66-5, Polyamine oxidase
 RL: ADV (Adverse effect, including toxicity); BIOL (Biological study)
 (in oxidative stress suppression of transmembrane and nuclear signal transduction in human T lymphocyte)
- IT 616-91-1, n-Acetylcysteine
 RL: BAC (Biological activity or effector, except adverse); BSU (Biological study, unclassified); BIOL (Biological study)
 (oxidative stress suppression of transmembrane and nuclear signal transduction in human T lymphocyte response to)
- IT 60-18-4D, Tyrosine, proteins containing
 RL: BSU (Biological study, unclassified); MFM (Metabolic formation); BIOL

(Biological study); FORM (Formation, nonpreparative)
(phosphorylation; in oxidative stress suppression of transmembrane and
nuclear signal transduction in human T lymphocyte)
